AI Usage Log - Sprint 2

Project Title: LaunchPadAI - Job Search and Application Tracking Platform

Course: SOEN 341 Software Process (Fall 2026)

Team Member: Ahcene Chouyoukh

Feature: Feature 4 - Recruiter (Sprint 2)

Repository Directory: AI_Log/Ahcene_Chouyoukh/

Tool: Claude (chat)

How I used AI: For each task, Claude gave me step-by-step instructions and code suggestions. I wrote and ran the code myself, then checked the result with Claude. When something was wrong or did not work, Claude corrected the steps and I fixed it. I tested every result myself in the app and in Supabase before committing.

Log Entry 1: Recruiter Dashboard (TASK-2.15)

What AI did / what I did: Claude explained what to build and where. I wrote the dashboard that lists the recruiter's postings and applications, and checked it with Claude.

Example prompt: "I need the recruiter dashboard to show my postings. Go one small step at a time, exact things to click or type."

AI response: Claude gave the first action only (which file to open and what to add) and asked me to report what I saw before the next step.

Validation: Logged in as recruiter1 and saw the test posting and test application.

Decision: Accepted after fixes. Applicant names first showed as "Applicant xxxx" because there was no profiles read policy; I added the policy afterwards.

Responsible Person: Ahcene Chouyoukh

Log Entry 2: Applicant Modal (TASK-2.16)

What AI did / what I did: Claude guided me to build the applicant modal with a View resume button. View resume first did not open the file; Claude explained it was a Supabase storage permission issue and I added the policy "Recruiters can read applicant resumes" myself.

Example prompt: "View resume does not open the file, what is wrong?"

AI response: Claude explained it was a storage permission problem and gave the steps to add a read policy for recruiters in Supabase.

Validation: After adding the policy, View resume opened the file as recruiter1.

Decision: Accepted after the correction.

Responsible Person: Ahcene Chouyoukh

Log Entry 3: Recruiter Navbar and Create Posting Form

What AI did / what I did: Claude gave instructions to hide My Resumes and Find Jobs for recruiters and to build the create posting form. I coded both and used workplace_type as the job type.

Example prompt: "Hide My Resumes and Find Jobs in the navbar when the user is a recruiter."

AI response: Claude showed how to read the user's role and only show the links for job seekers.

Validation: Checked the navbar with a recruiter and a job seeker account, and created a posting and saw it in Supabase.

Decision: Accepted.

Responsible Person: Ahcene Chouyoukh

Log Entry 4: Job Status Open/Closed (US-06)

What AI did / what I did: Claude gave steps for the status column, the Open/Closed toggle and the edit modal. I ran the SQL and wrote the code, then checked with Claude.

Example prompt: "Add a status column to jobs with a toggle to open or close a posting."

AI response: Claude gave the SQL for the column and the update call for the toggle, one step at a time.

Validation: Toggled a posting and edited it in the modal, then confirmed the change in the database.

Decision: Accepted after fixes.

Responsible Person: Ahcene Chouyoukh

Log Entry 5: CI and Pull Request (Issue #60)

What AI did / what I did: Claude explained how to write ci.yml (lint, tsc, Vitest) and how to open a pull request into main. I wrote the workflow and opened the PR.

Example prompt: "Help me create ci.yml that runs lint, tsc and Vitest for the frontend."

AI response: Claude explained the workflow structure and gave the steps to run in the frontend folder.

Validation: Pushed and checked the GitHub Actions run until the checks passed on the PR.

Decision: Accepted after fixes.
